

4.11 Result Changes from 4.9

Some results have changed between Source 4.9 and Source 4.11. The eWater development team maintains a detailed system to track when results vary between different version of Source. The areas with differences are:

- All regression tests had their reference results updated to match the Source results with exact precision. This allows any small variations that appear be identified immediately.
- There have been some bug fixes in the **Vic Carryover** Resource Assessment Trigger which have changed results.
- There have been a number of changes to the **Weir** algorithm, in particular for how ownership and conveyance flows are handled.
- The **Environmental Flow Manager** had a minor alteration to its distribution logic to correct a bug and avoid infinite loops.
- Units were now assigned to **Functions** created using the **Calibration Wizard**. A change in results is possible here with non-daily timesteps if the functions had been originally set up with incorrect units.
- The **Equalise Shares** option for **Off-Allocation Systems** has been removed. Projects using this option will need to be updated, which may cause results changes.
- Some projects were found to have incorrectly assigned **Data Sources** to models multiple times. An assurance rule has been created to identify the situation. When the problem is fixed, results may change.

To test your project:

1. Create a regression test in Source 4.9, see [4.9 Regression testing](#)
2. Run it in Source 4.11 to test for any result changes, see [4.11 Regression testing](#)

Details of changes for each beta release are here:

[4.10.0 Regression Test Changes](#)

[4.10.1 Regression Test Changes](#)

[4.10.2 Regression Test Changes](#)

If you would like help with your projects or would like to have your projects included for testing, please contact support: support.ewater.org.au
