

User Preferences and Settings

Settings are generally at three different levels:

- [Application settings](#) such as visible decimal places,
- [Project Options](#) such as unit preferences, and
- [Scenario Options](#) that you may want to change for different scenarios.

Performance improvement can be important for large models. Explore settings that can help with this under [Improving Performance](#).

Source graphs can be customised both individually and globally, from the Recording Manager or by choosing **Tools » User Chart Settings....** Refer to [Customising chart views](#) for further detail.
