

Exporting MUSIC Output Data Files

Data from MUSIC output can be exported for use in applications such as Microsoft Excel or other statistical software. There are three kinds of data export available - standard node or link data, additional node data, and meteorological data.

Standard data

Standard Data at a node or link is exported using the **Export** command on the **Context-sensitive** menu for the node or link, which opens the **Export Setup** dialog. You can choose which time-step to export the data in.

The screenshot shows the 'Export Setup' dialog box. It is titled 'Export Setup' and has a close button (X) in the top right corner. The dialog is divided into several sections:

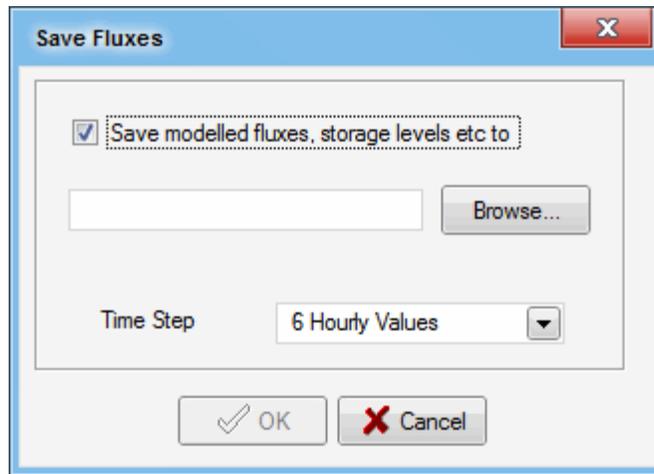

- Time Step:** A group box containing radio buttons for 'Daily', 'Hourly', 'User-Defined Time Step', '12 Hourly', '30 Minute', '6 Hourly', '12 Minute', '3 Hourly', and '6 Minute'. The '6 Minute' option is selected.
- Inflow:** A list of checkboxes for 'Flow', '[TSS]', '[TP]', '[TN]', 'TSS Load', 'TP Load', 'TN Load', and 'Gross Pollutant Load'. The 'Flow' checkbox is checked.
- Outflow:** A list of checkboxes for 'Flow', '[TSS]', '[TP]', '[TN]', 'TSS Load', 'TP Load', 'TN Load', and 'Gross Pollutant Load'. The 'Flow' checkbox is checked.
- Format:** A group box containing radio buttons for 'Space delimited', 'Tab delimited', and 'Comma delimited'. The 'Space delimited' option is selected.
- Buttons:** 'OK' and 'Cancel' buttons are located at the bottom right.

The data is exported as a space, tab or comma delimited file, for the subset of parameters selected. Full date and time is always exported as the first column. The  button opens a standard Windows Save As box, where a file name and save location can be specified.

Additional data

This can be exported from a node only. Since this function records data not otherwise saved by the program, it must be set prior to the simulation run. The

 button on the **Edit Properties** box of the node opens the Save Fluxes dialog (shown below).

Tick the check box, then use the  button to select a location and choose a new or existing file. The file will be generated after a simulation run.

Flux files are saved as .csv files, allowing for easier editing and management. Additionally, you can choose what time-step to save the file in using the **Time Step** drop down menu (as shown in the Save Fluxes dialog above).

The flux files that are generated contains:

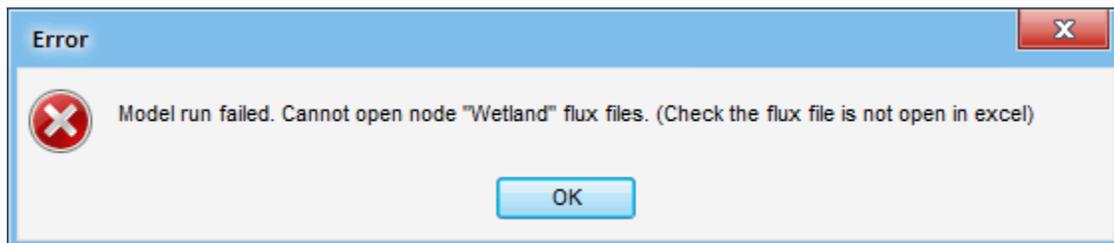

- A timestamp;
- Flow rate and water quality data for inflow, outflow, and each path through the node (low and high bypass, normal outlet, and overflow outlet);
- Water level and storage;
- Reuse demand and supply; and
- Evaporation and exfiltration losses.

Tip Box

Flux files should only be enabled when necessary, as the files produced can be very large.

Also, if a flux file is open using another program, trying to re-use it to run a MUSIC model will result in the following error being generated:

Ensure that the flux file is not open on any other application when using it in a MUSIC model.

Meteorological data

Meteorological Data can be exported using the **Meteorological Data** command on the **Catchment** menu, and selecting **Export** from the submenu. Enter a file name and location in the **Save As** dialog. No further setup is required.
